Lead & Pregnancy

Lead is toxic and easily absorbed into the body.

Lead in the body can cause lasting harm to the brain and other organs. A pregnant woman with lead in her body can pass it to her baby.

Lead exposure may increase risk of:

- Premature birth
- Small size and low birth weight
- Miscarriage or stillbirth
- Learning and behavior problems
- Sterility

If you are pregnant and live in or regularly visit a building built before 1978, you can request an educational visit in your home or at a local health center by calling 859-363-2049

If you have children under age 6, ask your child’s health care provider about testing for lead.
