Most people who get sick with COVID-19 will have only mild illness and should recover at home*. Care at home can help stop the spread of COVID-19 and help protect people who are at risk for getting seriously ill from COVID-19.

If you are caring for someone at home, monitor for emergency signs, prevent the spread of germs, treat symptoms, and carefully consider when to end home isolation.

*Note: Older adults and people of any age with certain serious underlying medical conditions like lung disease, heart disease, kidney disease or diabetes are at higher risk for developing more serious complications from COVID-19 illness and should seek care as soon as symptoms start.

Monitor the person for worsening symptoms. Know the emergency warning signs.

- Have their healthcare provider’s contact information on hand.
- If they are getting sicker, call their healthcare provider. For medical emergencies, call 911 and notify the dispatch personnel that they have or are suspected to have COVID-19.

People who develop emergency warning signs for COVID-19 should get medical attention immediately. Emergency warning signs include*:
- Difficulty breathing or shortness of breath
- Persistent pain or pressure in the chest
- New confusion or inability to arouse
- Bluish lips or face

*This list is not all inclusive. Please consult your medical provider for any other symptoms that are severe or concerning.

Provide symptom treatment.

- Make sure the sick person drinks a lot of fluids to stay hydrated and rests at home.
- Over-the-counter medicines may help with symptoms.
- For most people, symptoms last a few days and get better after a week.
When to end home isolation (staying home).

People with COVID-19 who have stayed home (are home isolated) can stop home isolation under the following conditions:

- At least 10 days have passed since symptoms first appeared; AND
- At least 24 hours have passed since last fever without the use of fever-reducing medications; AND
- Symptoms (e.g. cough, shortness of breath) have improved.

Individuals with laboratory-confirmed or clinically suspected COVID-19 with severe or critical illness or who are severely immunocompromised, should remain in isolation until all three of the following criteria are met:

- At least 20 days have passed since symptoms first appeared; AND
- At least 24 hour have passed since last fever without the use of fever-reducing medications; AND
- Symptoms (e.g. cough, shortness of breath) have improved.
